4 Tab layout - Most commonly used

TL;DR

Customers' basic content discovery issue, due to poor search relevance and disorganized SKU list, is the most critical to fix.

- Poor search relevance has been a persistent issue that we find in the last couple of studies (March-June 2021), thus **improving search relevance needs to come first**, as it is considered hygiene.
- Increasing filter/sort capsule visibility and rearranging the SKU list are advised to **improve the SKU catalogue from search result, item category, and promo list**.

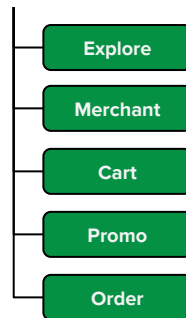

After addressing hygiene issues, navigation bar can be a silver bullet to solve the rest of GoMart's pre-booking issues that commonly stem from low feature visibility.

Navbar can..

- add more visible structure to the overall GoMart content;
- open more spaces to better showcase existing and new content;
- increase the perception of "more free/directive/focused discovery";
- eventually simplify the ineffective, back-and-forth navigation inside the app.

Suggested GoMart navbar menu, from the far-left to the far-right, are..

By distilling insights from various research projects, we found **4 GoMart user discovery modes**, based on..

1. shopping use case; and
2. focus of content sought when opening GoMart.

Straightforward Restocking	Regular Deal Hunting
Emergency Shopping	Idle Craving

GoMart can choose to target a certain mode, then tailor the navigation bar depending on its unique needs, as not all menu is critical to different discovery modes.

Navbar Menu Alternative: GoMart User Discovery Mode

[Slide 25 - 28](#)

Research Background

GoMart is going to implement a navigation bar design to revamp its homepage. In light of this plan, user insights are sought to guide the product team in conceptualizing the look of GoMart navigation bar that fits customers' needs and behaviour--and to explore solutions other than the navbar if any.

Business Objective

Revamp GoMart homepage that can boost visit-to-book conversion.

Research Objective

1. Understand customers' experience while navigating through the current app.
2. Understand customers' needs and expectations for the navigation process.
3. Find ways to improve the navigation process inside GoMart (not limited only to the navbar).
4. Understand customers' perceptions towards the proposed GoMart navbar idea.
5. Explore the need and potential elements for the navbar.

See [research plan](#) for more details and context.

Research Methods and Participants

Study Approach

- 1. Desk Research**
28 April - 5 May 2021
Click [here](#) to see the desk research result and initial navbar proposal.
- 2. Remote In-Depth Interview and Concept Testing**
28 May - 2 June 2021

IDI Sample Criteria

- Customers residing in Jabodetabek.
- Segmented into groups as follows. Participants will be mutually exclusive, tagged as per 17th May 2021. More information about GoMart user state can be seen [here](#).

Segment	Criteria	# Participant
Mature GoMart Users	• Has > 5 GoMart lifetime booking • GoMart order recency <= 30 days	2
Early GoMart Users	• Has 1-5 GoMart lifetime booking • GoMart order recency <= 93 days	2
Untouched GoMart Users	• Gojek tenure > 30 days • Have no experience ordering GoMart yet; may or may not have opened GoMart app before	2

Customers' Overall Discovery and Navigational Issues in GoMart

Understanding the needs and how they translate into room for improvements

We identified several common customers' needs in the GoMart's pre-booking journey, that are related to content discovery and app navigation.

Basic discovery needs that are felt by all participants are considered hygiene, while the rest are felt by majority/some.

[Hygiene] Ease to find item using search and browse.

[Hygiene] Merchant information (i.e. name, branch, distance).

Item availability comparison between merchants.

Ease to browse for deals.

Deals and price comparison between merchants/item/brands.

Reminder on what to buy for routine use case.

Space to carefully review all items before checking out.

Merchant branch selection.

Merchant rating.

Upfront merchant information (i.e. delivery fee and opening hour).

Most of the needs are only partially met, with some (including a hygiene need) are even unmet by our current app experience. (1)

NEEDS	NEEDS MET?	CURRENT STATE / ISSUES
[Hygiene] Ease to find item using search and browse		Inefficient searching process and too much scrolling. - Poor search relevance; irrelevant items are still shown in the search result due to similar and/or fuzzy keywords. e.g. Use “susu UHT” keyword, still get powder-based milk. Use “pisang” keyword, gets razor blade instead. - SKUs are placed in a random manner when it is not filtered/sorted. - Low filter/sort visibility. <i>See the past Homepage Onboarding and Project Disco for other reference.</i>
[Hygiene] Basic merchant info (i.e. name, branch, distance)		Already available within the merchant tile, on the GoMart homepage.
Item availability comparison between different merchants		Able to be done, yet by back-and-forth checking between stores, due to.. - Relatively low awareness of home search capability; some customers do not realize that this need can be fulfilled by the feature, in spite of them being able to spot the home search bar. “Choose merchant → Look for items inside the chosen store” is a natural ordering path for some customers.
Ease to browse for deals (e.g. promo items)		Inefficient deal browsing process. - SKUs are placed in a random manner when it is not filtered/sorted, be it from search, SKU category, and promo banner. - Low filter/sort visibility. - Low “Deals of the Day” visibility; not many customers scroll down the page and actually see the section. <i>See the past Project Disco for another reference.</i> - Promo is no longer available when a banner is clicked.

Legend

Unmet

Partially Met

Met

Most of the needs are only partially met, with some (including a hygiene need) are even unmet by our current app experience. (2)

NEEDS	NEEDS MET?	CURRENT STATE / ISSUES
Deals/price comparison between merchants/item/brands		Able to be done, yet by back-and-forth checking and too much scrolling, due to.. • Low awareness of home search capability for between-merchant comparison. • SKUs are placed in a random manner when it is not filtered/sorted. • Low filter/sort visibility.
Reminder on what to buy for routine use case		Able to access some content in the app that helps remembering, yet not all and not efficiently. • Customers revisit the order history, but the entry point in GoMart homepage suffers from low visibility. e.g. Some who are aware of the entry point do not really remember where the icon is located, while some who are not aware still open the order history from Gojek profile. • Low reorder widget visibility; not many scroll down the homepage. • Low past purchase section visibility; not many scroll down the merchant page. See the past Project Disco for another reference.
Space to carefully review all item before checking out		Already available in the checkout page.
Merchant branch selection		Not able to find branch alternatives, despite the available outlet selection feature. • Low outlet selection visibility. See the past Project Disco for another reference. • Lack of outlet density.
Merchant rating		Doubt when choosing unfamiliar merchant due insufficient information; stick with familiar options. Merchant rating not available yet in the platform.
Upfront merchant info (i.e. opening hour and delivery fee)		Able to get the information, but in the quite later part of the flow. • Greyed, closed store goes unnoticed + not able to identify which merchant is going to close/open soon. • Delivery fee can only be seen in the end of the pre-booking flow i.e. checkout page.

Legend

Unmet

Partially Met

Met

Summarizing the emerged issues, customers' basic content discovery is the most critical to fix, followed by back-and-forth navigational problem for between-merchant comparison.

From GoMart's perspective, it can also be clearly seen that we have **a lot of feature visibility issues and room to restructure content + develop new incremental features.**

	CUSTOMER POV ISSUES	ISSUE TAG	PLATFORM POV ISSUES	ISSUE TAG	URGENCY TO FIX
1.	[Hygiene] Inefficient searching process due to irrelevant results.	Basic content discovery	Poor search relevance.	Search relevance	
2.	[Hygiene] Too much scrolling from disorganized list.	Basic content discovery	- Low visibility of sort/filter. - Random SKU placing when not sorted/filtered.	Feature visibility Content structure	
3.	Back-and-forth to check item availability between stores.	Navigation	Low awareness of home search capability. Other comparison-enabling feature not available.	Onboarding Feature unavailable	
4.	Back-and-forth to compare price between stores.	Navigation	Low awareness of home search capability. Other comparison-enabling feature not available.	Onboarding Feature unavailable	
5.	Inefficient deal browsing process.	Secondary content discovery	- Low visibility of "Deals of the Day" + sort/filter. - Random SKU placing when not sorted/filtered. - Outdated promo banner.	Feature visibility Content structure	
6.	Inefficient content discovery for repeated-item recall.	Secondary content discovery	Low visibility of order history entry point in homepage, reorder widget, and past purchase section.	Feature visibility	
7.	Unable to find branch alternatives.	Secondary content discovery	- Low visibility of outlet selection. - Lack of outlet density.	Feature visibility	
8.	Doubt when choosing unfamiliar merchant.	Insufficient decision making point	Merchant rating not available.	Feature unavailable	
9.	Back-and-forth to check more merchant information	Navigation & Insufficient decision making point	- Low visibility of greyed-out feature for closed store. - Ineffective content placement.	Feature visibility Content structure	

General Recommendations

- > Addressing the Hygiene Issues
- > Navbar as a Silver Bullet

General Recommendation: Addressing Hygiene Issues

Solving the basic content discovery problem needs to come first. Search relevance has been a persistent issue that we find in the last couple of studies.

Inefficient searching due to relevancy issue

- Search "Mama Lemon" (i.e. cleaning product brand), gets lemon candy, lemon drink, and Mamasuka dried seaweed.
- Search "pisang", gets Gillette razor blade.

Recommendation:

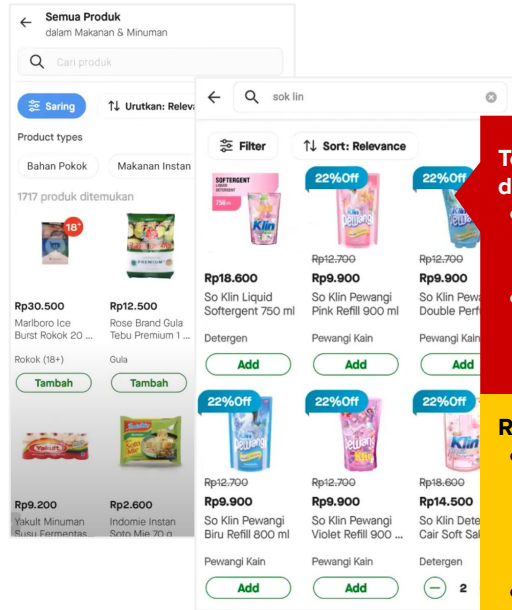

Increase search relevance, including fixing fuzzy search cases.

References:

[Homepage Onboarding Research](#) (March 2021)
[Project Disco](#) (June 2021)

General Recommendation: Addressing Hygiene Issues

Recommendations have already been made available in the previous research on improving GoMart SKU catalogue structure, be it from the search result, item category, and promo list.

Too much scrolling from disorganized list

- The list of SKU is not structured by any proxy (e.g. alphabet, SKU sub-category).
- Filter/sort looked unclickable and out of sight, as users naturally want to scroll down.

Recommendation:

- Increase the visibility of filter/sort capsules, or structure the SKU list based on SKU sub-category/brand/ alphabetical name.
- Structure the search result based on SKU category or subcategory, for targeted search by brand.

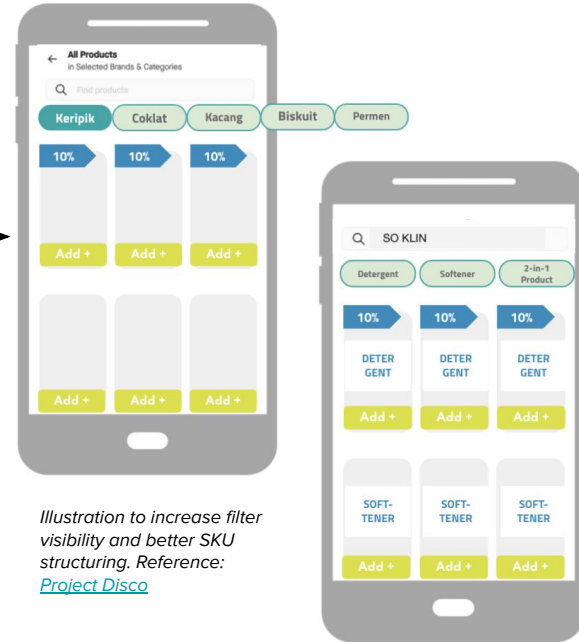

Illustration to increase filter visibility and better SKU structuring. Reference: [Project Disco](#)

General Recommendation: Navbar as a Silver Bullet

After addressing the hygiene cases, navigation bar can be a silver bullet to solve the rest of GoMart's pre-booking issues that commonly stem from low feature visibility.

The benefits of navbar in solving multiple pre-booking issues..

Adding more visible structure to the overall GoMart content.

Can better display features with low visibility, which are:

- deals of the day
- reorder widget
- past purchase items
- order history
- outlet selection

Opening more spaces to better showcase existing and new content.

More room to unveil and show new features, such as:

- item/price comparison, especially for users whose natural path is “choosing merchant → choosing item”
- envisioned shopping list; what-to-buy reminder
- envisioned pick-up

Increasing the perception of “more free/directive/focused discovery”.

Customers can go straight to their preferred content in the navigation bar menu.

"I can roam more freely in the app, like in e-commerce. When entering GoMart now, the vibes is very much like choose merchant → choose items → checkout only."
-- Athalia, Mature User

Eventually could simplify the ineffective, back-and-forth navigation inside the app.

General Recommendation: Navbar as a Silver Bullet

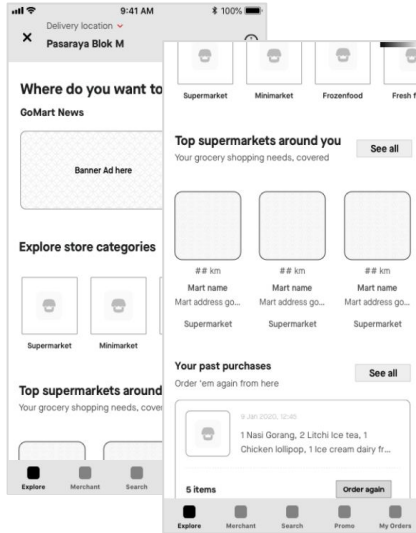

Below are the suggested menu for GoMart navbar, based on considerations from multiple standpoints.

Suggested GoMart Navbar Menu organized from the far-left to the far-right		PLATFORM NEEDS	CUSTOMER NEEDS
	Explore	As the landing page of GoMart; to introduce the overall service offering and to shape customers' perception on the product.	To access and get a glimpse of the key content without needing to visit other navbar menu.
	Merchant	• To showcase the wide range of merchants. • To increase outlet selection visibility.	• To see merchant category (for overview), merchant brands, and available branches from each. • Choosing store is currently the first, prominent natural step that customers do after opening the app.
	Cart	• To better encourage users to add more items to the cart; current pre-booking experience is still strongly "quick in-and-out". • Mandatory to facilitate the possibility of multi-cart in the future. This shall allow users to do item/price comparison and solve the "need to build cart from zero when changing merchant" issue. See the past Multi-Merchant MVP UT for reference.	• To focus on reviewing item list, quantity, and price before checking out. • Some customers (especially routine shoppers) take their time to build their cart; slowly adding item and not ordering immediately. See Project Disco for reference.
	Promo	• To build a comfortable deal browsing aura. • To increase promo-related features' visibility.	• To easily to browse for deals (e.g. promo items). • To easily compare deals between merchants/items/brands.
	Order	To better display the order history's entry point.	More intuitive access to order history; help recalling what to buy based on past purchases.

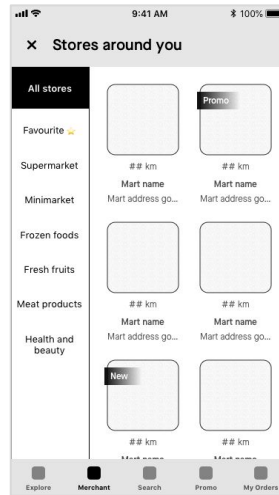

General Recommendation: Navbar Feedback and Suggested Content

Through the concept testing, we learned that customers' content expectations for each menu are mainly aligned with what GoMart has in store. Some feedback are offered to further optimize the design.

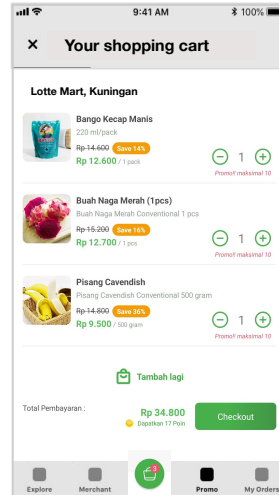

Click on the hyperlink for insight deep dive per menu

[Explore Menu](#)

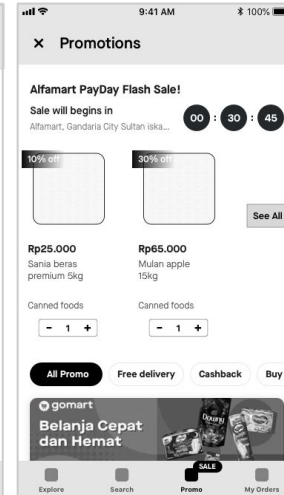

[Merchant Menu](#)

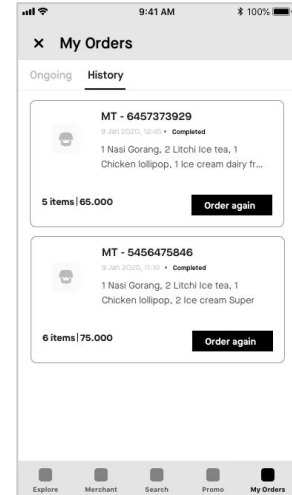

[Cart Menu](#)

(Not presented in the concept testing, as this is a user-generated idea)

[Promo Menu](#)

[Order Menu](#)

General Recommendation: Navbar Feedback and Suggested Content

As the landing page of GoMart, content in the Explore menu is generally meeting expectations, except for the menu naming itself.

Search bar is expected.

Good to skim through announcement/promos.

Merchant categories are “equally visible”.
Better merchant overview without having to scroll down to find more stores.

“Explore” is difficult to understand for some people.
Not everyone was sure what it is; have trouble imagining the content.

RECOMMENDATIONS

- **Add search bar** to the current proposed content.
- **Add item recommendations** based on previously bought/searched, or based on items added to the cart.
- **Stick to “Explore” for now**, learning from [GoFood Navbar 2.0 UT](#)--despite an option to consider “Home” or “Beranda” for the naming.

Seen as “the closest amongst the closest” recommendations.

Reorder widget is appreciated as a shortcut to order history, although suffers from low visibility in the current homepage version.

FOOD FOR THOUGHT

HMW cherry pick and transform contents from other menus to be displayed in Explore, **without making them appear redundant** in the app?

Legend

- Expectation
- Delight
- Pain

General Recommendation: Navbar Feedback and Suggested Content

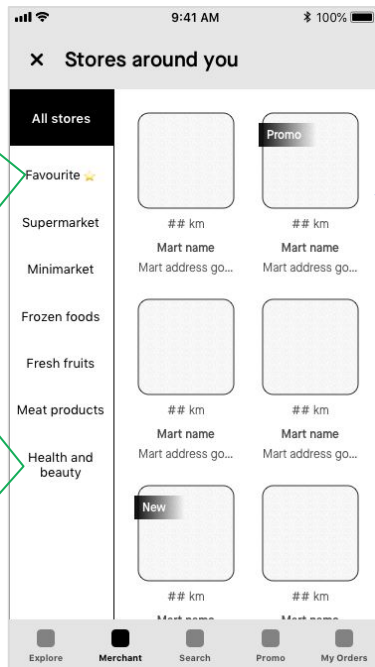

A straightforward store list is expected to be the sole content in the Merchant menu, with rich information about each shop.

Helpful to mark preferred/frequently visited stores.

Customers can refer to this group; do not have to browse that much every shopping time just to look for the merchants.

Store grouping helps easing discovery.

Especially that we display both the grouping and store list on the same page; customers do not have to visit different pages just to see the store list after clicking the category.

Expect to see more store options than recommendations in the Explore/homepage.

RECOMMENDATIONS

- **Include branch/outlet selection** in this menu, as a means to display more store options and to increase outlet selection visibility.
- **Consider adding more information** to aid customers' decision making, such as:
 - "almost closed" or "closed in x minutes" flagging;
 - merchant rating;
 - estimated delivery fee.

Legend

Expectation

Delight

Pain

General Recommendation: Navbar Feedback and Suggested Content

Cart menu adds another step to the overall order flow, yet it offers more space for customers' item list review and cart-building.

Auto-price and stock update.

Customers might add some items to the cart not for immediate checkout.

When they visit the cart again, they expect that the item price and stock there are well-updated (e.g. based on promo, actual stock availability).

A place to review all items before checking out.

Item, size, price, from which stores, and with ability to add/remove quantity.

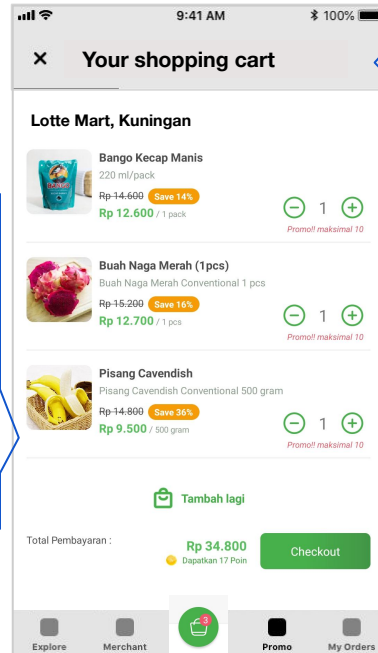

Illustration: Cart menu in Sayurbox.

RECOMMENDATIONS

- **Position this page as an extra step before actually checking out** (i.e. confirming address, payment, and other order details). This would give customers enough space to go through all that they need to review. See [Project Disco](#) for another reference.
- **Consider enabling multi-cart** in the future. See the rationale [here](#).
- **Provide relevant item recommendation section**; can be based on items in the cart or past purchase, to help customers remember what to buy.

Legend

Expectation

Delight

Pain

General Recommendation: Navbar Feedback and Suggested Content

More content and types of promo are suggested by customers, such as merchant membership and loyalty points.

The screenshot shows the GoMart Promotions page. At the top, there's a header with 'Promotions' and a close button. Below it, a banner for 'Alfamart PayDay Flash Sale!' indicates the sale starts in 00:30:45. Two product cards are visible: 'Sania beras premium 5kg' for Rp25.000 with a 10% off discount, and 'Mulan apple 15kg' for Rp65.000 with a 30% off discount. Below these are 'Canned foods' with a quantity selector set to 1. At the bottom, there are buttons for 'All Promo', 'Free delivery', 'Cashback', and 'Buy x'. A 'gomart' logo and a banner 'Belanja Cepat dan Hemat' are also present. The bottom navigation bar has five icons: Explore, Merchant, Search, Promo (active), and My Orders.

Want to see a strike price to the discounted items to ease spotting the final price.

Category allows more targeted promo browsing.

A “station” to any promotional content in GoMart.
e.g. Item promo grouped by SKU category or by merchant, delivery fee, cashback, flash sale, merchant membership, loyalty point.

RECOMMENDATIONS

- **Add item final price** after promo/discounts.
- **Add share promo feature**, as word-of-mouth is quite strong amongst customers, especially moms.
- **Consider other promo content ideas**, such as:
 - offline store membership that allows customers to get special price, collect/redeem points based on merchants' program. See the past [Feature Competitive Analysis](#) for another reference.
 - GoMart loyalty program (e.g. “transact x times, get x% discount for the next purchase”, light games to collect points mimicking e-commerce).

Legend

Expectation	Delight	Pain
-------------	---------	------

General Recommendation: Navbar Feedback and Suggested Content

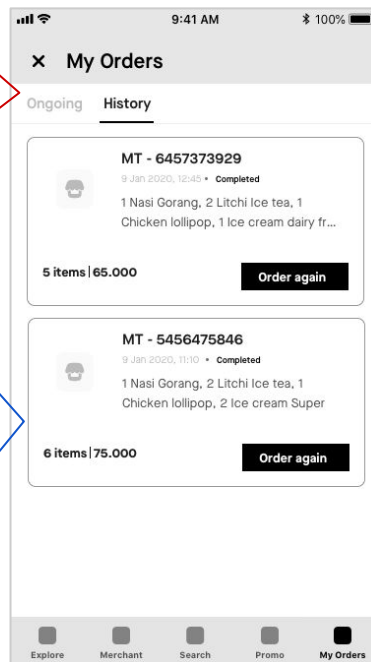

Order can be further simplified to optimize the navigation inside the menu.

Different tabs might cause unnecessary clicking or navigation to see orders from different groupings.*

*Pain point might only apply on rare occasions i.e. customers have ongoing order, but want to check the order history.

Expect to see item replacement options/details here.

Item replacement options is a feature similar to what HappyFresh has. See the past [Edit Order Exploration](#) study for reference.

Already meet the expectation to see both ongoing and past orders.

RECOMMENDATIONS

- **Add the item replacement details for each order** after the feature is rolled out in the future. This includes:
 - the chosen item replacement option by customers;
 - updates on the replacement that has taken place.
- **Consider displaying all ongoing and completed order in a single page** without separating them by tabs, structured by history.

Legend

Expectation

Delight

Pain

General Recommendation: Other Navbar Essential Suggestions

There are several points to adhere when implementing the navbar design.

1

Use coachmark, tooltip, or tutorial to highlight the new navbar.

All research participant did not recognize the navbar the moment they saw the concept.

- This is expected, similar to the challenge GoFood team faced in early navbar implementation. Reference: [GoFood Navbar 2.0 UT](#).
- This might also be influenced by the research stimulus limitation (i.e. wireframe visual).

2

Place the most “critical” bar in the center for easier recognition.

In a 5-menu navigation bar, center point is suggested to be the Cart menu.

- Center point is the most **visually attracting position** for customers in an unconscious level.
- Consciously, customers perceive this as the “**main position in the stage**”.
- Placing Cart in the center shall **aid GoMart’s strategy to expand the ad-hoc users’ cart into more routine needs**.

3

Design an integrated flow/navigation between menu and content to avoid redundancy.

Example:

- Clicking "See All Merchant" in the Explore shall redirect users to the Merchant menu.
- Clicking reorder widget in the Explore shall send users to the past order detail page, under the Order menu.

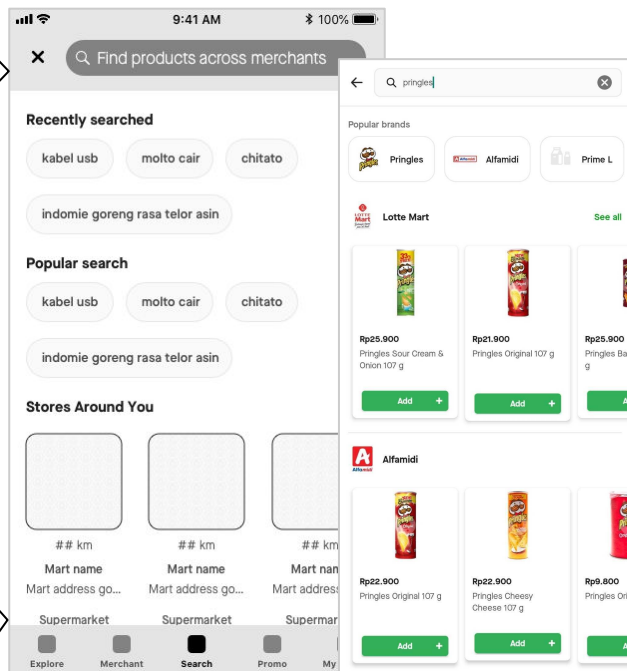

General Recommendation: Why Excluding Search?

Search is one of the navbar menu that we initially proposed to the customers, yet primary research reveals that its benefit might still be below other potential menus.

Some users think that this menu is not really needed, since a search bar is expected / already present homepage.

"Feels like I need to go somewhere else just to use the search bar."
-- Abi, Early User

Learning from GoFood: Search from Explore entry point is significantly higher than of the Search menu itself. [Dashboard](#) for reference.

Other solutions can be considered to increase home search visibility and awareness of its capability to do merchant comparison (aside from placing Search as one of the navbar menu).

RECOMMENDATIONS

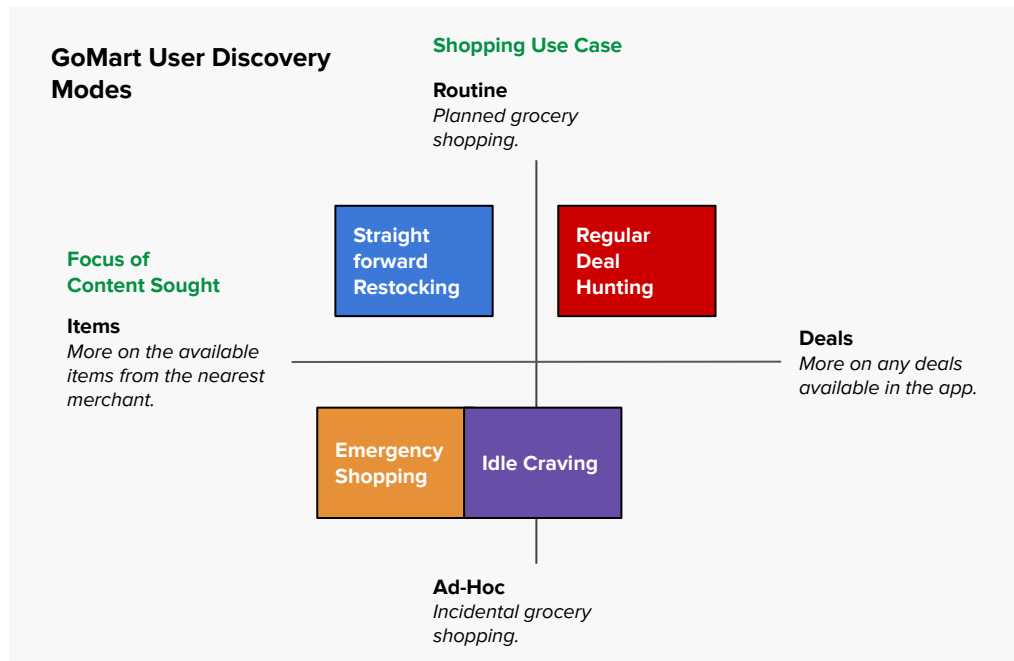

- Add coachmark/tooltip to highlight the current home search's ability in the homepage.
- Explore other ideas to solve the back-and-forth comparison issue between stores. This should be extra helpful for customers whose natural ordering path is choosing store → choosing item.
- We can still include Search in the navbar MVP to monitor its performance first; GoMart might have different search pattern to GoFood.

Navbar Menu Alternatives

Tailored based on customers' discovery modes

We identified 4 GoMart user discovery modes after distilling insights from various research projects.

The user discovery modes are dependent on (1) their **shopping use case** and (2) the **kind of content they focus on seeking** when opening GoMart.

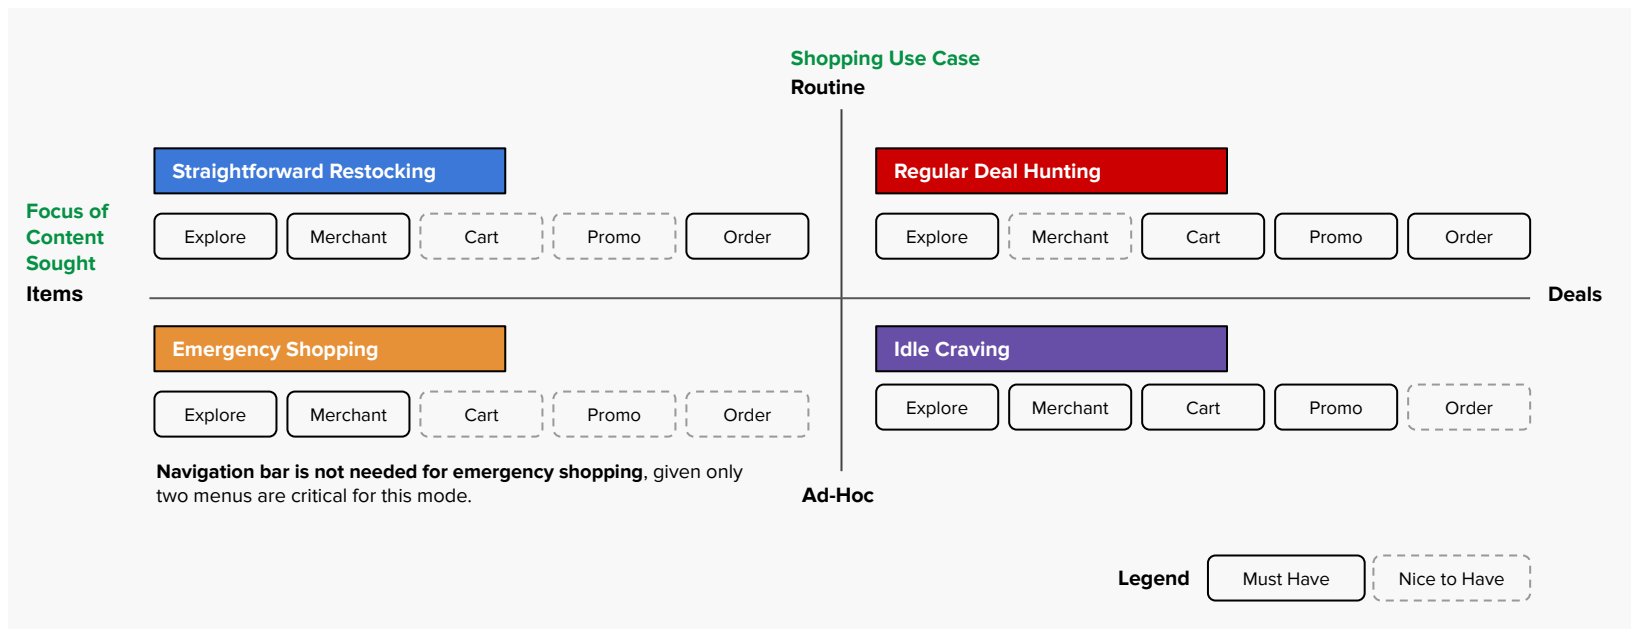

Important Notes

- **These modes are not exclusive to a single user.** A customer can take on different modes, on different states/moments/occasions.
- **Focus on item sought is a tendency.** It does not mean that customers who seek items do not seek promo at all, and vice versa.

A closer look at GoMart User Discovery Modes..

	Straightforward Restocking	Regular Deal Hunting	Emergency Shopping	Idle Craving
USE CASE	- Normally routine monthly grocery. - Some bi-weekly/weekly restock (for high-income customers).	Normally routine bi-weekly/weekly.	Ad-hoc urgent.	Ad-hoc craving.
ITEMS TO BUY	Highly predictive, repeated purchase item variants.	Repeated purchase items with different variants. Reference: Project Disco .	Incidental emergency items; can be anything.	Incidental craving items, usually snacks and/or drinks.
FOCUS OF CONTENT SOUGHT	More on items to buy, from the nearest, preferred merchant available.	More on deals (discounts, cashback, etc) that can lower the overall shopping cost.	More on items to buy, from the nearest merchant available.	Can be more on items, can be more on the deals.
DISCOVERY/ NAVIGATION BEHAVIOUR	Quick in-and-out; straightforward discovery to look and choose items/ merchants, rarely explore the app. Promo is just a sweetener; just occasionally browsed.	Explore the app for promo and variants; seeking inspirations that cater to preference. Reference: Project Disco. Deliberate promo checking. Price comparison between merchants/item/brands. Takes time to build the cart.	Quick in-and-out; straightforward discovery to look and choose items/ merchants. Usually do not even think of exploring the app further, let alone looking for complementary item/promo.	A combination of quick in-and-out and app exploration, depending on the situations. - Quick in-and-out when already know exactly what to buy. - Explore the app to seek inspirations when still open for alternatives.
SPECIFIC NEEDS	- Item availability comparison between different merchants. - Reminder on what to buy. - Merchant rating.	- Deals reminder/notification. - Deals and price comparison between merchants/item/ brands. - Structured SKU list for promo. - Updated price when revisiting item list in the cart. - Reminder on what to buy. - Merchant rating and delivery fee upfront.	- Item availability comparison between different merchants. - Merchant opening hour upfront, especially near closing time.	- Item availability comparison between different merchants. - Structured SKU list for promo.

GoMart can choose to target a certain mode, then tailor the navigation bar depending on its unique needs, as not all menu is critical to different discovery modes.

Thank you
