

GoMart Studio Session 1 Synthesis

[Sacha's session 1 notes](#)

Primary Questions: Discovery

Autonomous Platform(Nation-1)

INTRO EXPERIENCE IDEAS [1]

- Provide an intro tour (or set of cards): Can some type of tour or intro to GoMart showing how it works and what it costs, help drive engagement and even collect some preferences?
 - Does providing a clear choice to learn about Covid safety help with engagement/conversion?
- Create A Process Overview: Can we provide an overview of the order process (even before they begin)?
 - Is there a set of cards that we could show them that would lead them to various things like this (order process, covid safety, price comparison, quality, assortment, reliability, delivery times, communication with picker, who picks up the items, payment method and delivery fee, stock update in the app)?
- Prompt for intent & customize: With a 40% drop on the Gomart home, would asking an initial question about intent help create a high converting personalized experience?
- Design For Discovery: How might we design an experience and pathway specifically for people who do not know what they are looking for?
- Test into drop-off on home: Is the 40% drop on home page due to 1) not understanding the value or experience, 2) not seeing merchants or products they like, 3) because they are just checking it out, 4) something related to cost, 5) some other reason?

- Messaging & personality: How can we bring some delight – even attitude and humor – into the experience through messaging that gives choices? (eg, feeling lucky or random item (netflix did this successfully for discovery)). “This weeks item...” and some way to like/dislike.

NEW UI ARCHITECTURE [4]

- Leverage GoFood UI patterns: Since 70% of new customers are existing GoFood users, could a similar discovery experience increase ease-of-use and drive engagement?
- Mapping to offline experience: How can we address head-on the people who prefer traditional way of shopping?
 - Could we highlight the human aspect – someone shopping for you (vs. online)?
 - What would that look like? Could we show them some pictures of actual pickers and quotes talking about the experience? (both pickers and customers)
 - How might we replicate an offline experience? Can we provide multiple views for browsing?
 - HMW replicate the social aspect of shopping offline?
- GoFood Recommendations: How can we leverage what they have purchased in GoFood to recommend items? Because you ordered nasi goreng....(give some way to like or dismiss)

PROMOS[5] Deal Hunter

- Create specialized pathways
 - Create experience just for promo hunters: For promo vs. non promo hunters, would asking or filtering based on these shopper “types” help us provide more targeted recommendations that drive engagement and conversion?
 - HMW tap into GoFood behavior (e.g. GoFood promo hunter)

- Create an experience just for core groceries: Would creating a focused experience targeting core groceries increase initial engagement (since that is the dominant first use case)?
 - HMW better differentiate promo hunters vs non-promo hunters?
- Promos: What types of promotions would drive initial engagement? 1) free delivery, 2) free delivery within X radius.
- Item or promo runs out: provide a way to be alerted and offer even better deal if they accept (can automatically deliver when available - maybe with confirmation)
- Improve experience for outlet unavailable, promo expired: How to handle when their preferred outlet is unavailable? When a promo has expired? (these are all drop off pts)

Effective Communication(Nation-2)

ADDRESS CUSTOMER CONCERNS[6]

- Turn Delivery Cost into a "pro": Could we convert issues about delivery cost into a pro in the initial experience? Eg, by showing the delivery cost but saying is covered for the initial order. Maybe promo for GoClub and free deliveries at level X.
- Showcase variety & assortment, then narrow down: How can we measure perception of "variety" and "assortment"? Can we create a browse experience that emphasizes the variety and lets people narrow down quickly?
- Make price concerns actionable: Can we address head-on the price/expensive issue by letting users mark items as "too expensive"? By offering a way to mark as too expensive and see comparable items? Can we give an indicator of whether this is a relatively good price (trends over time)? (would this data help, hurt, be flat?)

- Smart Suggestions: Detect when fee is more than the purchased item and suggest additional items.

Maximised Value(Nation-3)

SEARCH AS PRIMARY EXPERIENCE[2]

- Make search a primary experience: (with better filters etc) 54% > 13.1% drop without performing a search. What if search was more of a primary experience? Would this enable better personalization and recommendations? Could we have different search result formats based on inferences about the type of search? (below) [view search research](#)
 - *[list specific items and help narrow in on them]* If they use a brand name, then assume they are looking for a specific item
 - *[compare items and brands side-by-side]* If they use a generic SKU name like cooking oil, then assume they want to compare brands, prices, variants
 - *[search filters]* What type of search filters could we provide that would a) offer actionable choices, b) help us learn preferences?
 - Low relevance results: prompt user for refinement vs. showing low quality results.
- Differentiate recommend, search, browse paths: Do shoppers want recommendations? Or do they prefer to search or browse?
 - Does offering SKU combos (milk+bread+eggs) increase engagement?
 - Would having a prompt "More like this..." or "If you like <item> you might like <items>" encourage more engagement?

BETTER BROWSING

- Break up browsing experience: How can we create variation in the browsing/scrolling experience that breaks the flow and prompts for other actions, offers, behaviors, search filters etc?

- Can we ask people while browsing: “Seems like you aren’t finding what you want. Would you like some help?” > take them to a search page with selectable filters.
- Recipes: Would recipes be a driver for engagement and ordering?

COMPARISON SHOPPING [3] 💰 Deal Hunter

- Quality & Price: How can we provide assurance of order quality, assortment and price?
- Comparison shopping: Would creating a “comparison shopping” experience between merchants drive engagement?
- Create trust & quality indicators for merchants: Merchant page drop-off is 50% (23% don't select anything). Less than 10% visit a new merchant – they drop off after 60 secs.
 - What variations can we create to see what attracts users?
 - Once users select a merchant, how can we provide more relevant choices that would enable them to take action or provide feedback in a way that reflects their intent?
 - How can we determine if the drop-off is 1) price sensitivity, 2) related to locating specific items, 3) something else?
 - Does trust about a merchant and/or their products influence engagement and drop-off?
 - Would SKU and/or merchant ratings help with initial experience?

Other Questions: Not discovery related

- How can we handle the situation when their preferred store is closed? (not discovery related since they need to indicate that the store is preferred previously)
- What are the primary messaging related issues and comm between customer and shopper/drive? How can we improve these?

- For repeat shoppers, what is more valuable 1) enabling repeat ordering, 2) selecting items from the previous list, 3) suggesting items based on previous orders?
- How might we report missing items, deliver missing items for a different mart or at a different time from the same mart?
- Can we provide X free deliveries per month for certain GoClub tiers?
- For promos and locations not yet available for their area, can we prompt for their email to alert them when they are available?
- How might we encourage exploring other outlets? Would recommendations for 1) existing items, 2) new but related items...be considered valuable?
- How can we address issues with promo items running out quickly even when they are in the cart?
- Stock allocation issues: its on a first come, first serve basis so it can run out even after placing the order. (low service quality experience)
- Exit gracefully: What kind of nudge can we provide when people leave that would make them smile? Provide a feedback opportunity > leverage for follow up engagement (esp if outlet or promo related).

Value Prop / Messaging (to test)

- A service to ask Gojek drivers to buy grocery items for us.
- Convenient, reliable, easy, efficient & transparent
- Competence
- On-demand, instant delivery
- <something about search - 80% of items added to cart>
- Monthly=big, bi-weekly=restock, weekly/daily=fresh
- How can we provide assurance of order quality, assortment and price?
- What are the key gomart features that would persuade 1st time users?
- Build an experience catered to you...
- Unique assortment
- Effortless (what does this mean?)
